Dear Hiring Manager,

I am a Software Engineer with experience in backend development, scalable systems, and full-stack applications. I have built and maintained systems handling real-time data, user authentication, and high concurrency, with a strong focus on performance, reliability, and clean architecture.

In my recent work, I developed backend services, designed APIs, and implemented systems supporting large numbers of users. I worked with technologies including Node.js, React, SQL, and Docker, and contributed to system optimization, reducing load times and improving overall performance. I am comfortable working in distributed teams using Git and Agile workflows.

I have also built projects involving data processing and machine learning using Python and TensorFlow, as well as web applications that integrate external APIs and provide real-time insights. These experiences strengthened my ability to design end-to-end solutions across different domains.

My core strengths are problem-solving, system design, and writing maintainable, efficient code. I adapt quickly to new technologies and focus on delivering practical, scalable solutions.

I am looking for opportunities to contribute to backend or full-stack systems in a professional engineering environment.

Sincerely,
Abd Ennour Abbes
